

materials required for preparation of thermal insulation façade systems

Workshop

Connection window profiles (trimming window profiles) with fibre glass

Connection window profiles (trimming window profiles) with fibre glass mesh 6 mm and 9 mm (corner beads for windows and doors with fibreglass mesh, for external use) protects windows and doors from impurities and mechanical damage during mounting of thermal insulation façade system. They insulate against cold weather and noise by

providing better sealing properties achieved by product design features. They provide perfect aesthetic finishing. Part of the profile which is not coated with finishing materials is easy and simple to remove after work, leaving perfectly straight arris. Fibreglass mesh facilitates and makes final treatment of façade less time-consuming.
